MEMORANDUM

SUBJECT: Decision Document for the Time Critical Removal Action at the San Jacinto

River Waste Pits Site, Harris County, Texas

FROM: Valmichael Leos, Remedial Project Manager (RPM)

Remedial Branch, -LA/-, NM/-, OK Section (6SF-RL)

THRU: Carlos Sanchez, Chief of Arkansas, Texas Section

Remedial Branch (6SF-RA)

TO: Charles Faultry, Associate Director

Remedial Branch (6SF-R)

THRU: Carlos Sanchez, Chief of Arkansas, Texas Section

Remedial Branch (6SF-RA)

I. PURPOSE

This Memorandum documents EPA's decision for selection of a removal option at the San Jacinto River Waste Pits site (the "site") located near Houston, Texas in the city of Baytown, Harris County, Texas (Attachment 1). On May 174, 2010, an administrative order on consent (AOC) was issued to the International Paper Company, Inc. and McGinnes Industrial Maintenance Corporation (the "PRPs") for a Time Critical Removal Action (TCRA) at the site. The PRPs were requested to submit a technical memorandum that will evaluate all removal option alternatives for the design and construction of a physical barrier surrounding waste ponds 1 and 2 that will satisfy the performance requirements temporarily abate the release or threat of release of dibenzo-p-dioxins and polychlorinated dibenzofurans into the San Jacinto River as outlined in the TCRA Memorandum dated April 2, 2010 (Action Memo). A final technical memorandum was submitted to EPA on June 15, 2010, for review and analysis.

A. Site Description & Environmental Threat

The site encompasses approximately 25 acres. The removal action is to <u>stabilize the site</u> by <u>designing and constructing a physical protective barrier surrounding waste ponds 1 and 2 that stabilize the site</u>, temporarily abatesing the release of polychlorinated dibenzo-p-dioxins and polychlorinated dibenzofurans (and possibly PCBs) into the <u>San Jacinto Riverwaterway</u>, until the site is fully characterized and a remedy is selected.

The Site, as indicated in Attachment 1, is in Harris County in the State of Texas. The Site itself has no specific street address. The Site is comprised of an area of land with a set of two waste ponds with three surface impoundments built in the 1960s for disposal of pulp and paper mill wastes. The site is located in a marsh on a 20-acre parcel partially submerged on the western bank of the San Jacinto River, in Harris County, Texas, immediately north of the Interstate Highway 10 (I-10) bridge over the San Jacinto River. Prior to 1965, the two waste ponds were built by constructing berms within the estuarine marsh just north of what was then Texas State Highway 73 and is now I-10, west of the main river channel east of the City of Houston between two unincorporated areas known as Channelview and Highlands.

The waste paper sludge was placed in the two ponds on the Tract. Waste pond 1 is located on the western portion of the Tract totaling 132,386 square feet. Waste pond 2 which consists of two surface impoundments are on the eastern portion of the Tract totaling 46,182 square feet and 188,641 square feet respectively. Currently, the Tract is inactive and approximately half of the Tract's surface area, including the abandoned waste disposal ponds, is now submerged below the adjacent San Jacinto River's water surface. Waste pond 1 with one impoundment is partially submerged and waste pond 2 with the two impoundments is completely submerged in the San Jacinto River.

Formatted: Indent: First line: 0.5"

Formatted: Underline

Formatted: Indent: First line: 0.5"

The primary hazardous substances documented at the Site are polychlorinated dibenzop-dioxins and polychlorinated dibenzofurans. At the time of the signing of the Action Memo, dDioxin concentrations as high as 41,300 parts per trillion have been found in sediment samples collected from the Tract's disposal pond areas and from river sediments near the Tract. Sediments contaminated with high levels of dioxin have been found in the San Jacinto River both upstream and downstream from the Tract due to tidal influences. Additional sediment samples were collected in compliance with the Action Memo, dioxin concentrations as high as 360,000 parts per trillion have been found in sediment samples collected from the submerged portion of the waste disposal ponds as well as dioxin concentrations as high as 3,660 parts per trillion action level in sediment samples collected outside the original 1966 berm placement for the two waste ponds indicating the release of dioxin from the original location of the waste ponds.

B. Release or Threatened Release into the Environment of a Hazardous Substance, or Pollutant or Contaminant

Formatted: Underline

Concentrations higher that 330 parts per trillion of pPolychlorinated dibenzo-p-dioxins and polychlorinated dibenzofurans have been detected in sediment and surface water at the site within the-original 1966 boundaries of the waste ponds and within 100 feet of the waste ponds. Dioxins and furans are "hazardous substances" as defined by Section 101 (14) of CERCLA, 42 U.S.C. §9601 (14).

C. NPL Status

Formatted: Underline

The Site was proposed for listing on the National Priorities List ("NPL") on September 19, 2007 (72 FR53509), and was placed on the NPL effective March 19, 2008 (73 FR 14719).

2.E. Current Actions

On July 17, 2009, EPA sent a Special Notice Letter to the Respondents offering them an opportunity to negotiate and enter into an Administrative Order on Consent ("AOC") covering the performance of the Remedial Investigation and Feasibility Study (RI/FS) of the Site. However, EPA never received a Good Faith Offer in which to begin negotiations of a RI/FS for the Site.

On November 20, 2009, EPA issued a Unilateral Administrative Order (UAO) to International Paper Company, Inc. and McGinnes Industrial Maintenance Corporation to conduct a RI/FS to study the nature and extent of contamination at the site.

On April 2, 2010, EPA determined an imminent and substantial (ISE) endangerment to public health and the environment at the San Jacinto River Waste Pits Superfund Seite for the threat and actual release of dioxin into the San Jacinto River and issued a time critical removal action (TCRA) memorandum.

On May 174, 2010, EPA enteredissued an Administrative Order on Consent (AOC) withto International Paper Company, Inc. and McGinnes Industrial Maintenance Corporation to conduct a time critical removal action to temporarily address the release of dioxin into the San Jacinto River, whileuntil the nature and extent of contamination at the site is being fully characterized and a remedy is selected.

III. TCRA MEMORANDUM

A. Proposed Actions & Performance Criteria

The proposed action for the April 2, 2010, Action Memo (see Attachment 2) involves the immediate design and construction of a physical protective barrier surrounding waste ponds 1 and 2 that temporarily addresses the release or threat of release of dibenzo-p-dioxins and polychlorinated dibenzofurans into the San Jacinto River, until the site is fully characterized and a remedy is selected. In addition to a physical protective barrier to keep the waste secure, there is currently unrestricted public access at the site. Public access restrictions must be put in place immediately following the approval of this action memorandum. The public access restrictions should involve placement of security fences and signs to prevent trespassing onto the property. The security fencing will prevent access of unauthorized persons into the entire area containing the waste impoundments.

Formatted: Indent: First line: 0.5", No bullets or numbering

Formatted: Bullets and Numbering

Formatted: Underline

Formatted: Indent: First line: 0"

Sampling was conducted within the original 1966 berm and the area immediately surrounding the original 1966 berm line surrounding waste pit 1 and 2. Any concentrations greater than or equal to 330 ng / kg of 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD) organic carbon normalized (or 4.5 ng / kg TCDD non-organic carbon normalized) in the sediment found within the original 1966 berm will be considered part of the source area of contamination within the original 1966 berm placement that must be addressed with the protective barrier. Any concentrations of less than 330 ng / kg of TCDD organic carbon normalized (or 4.5 ng / kg TCDD non-organic carbon normalized) found in the sediment will be addressed in future non-time critical or remedial actions at the site.

The barrier design and construction must be structurally sufficient to withstand forces sustained by the river including any future erosion and be structurally sound for a number of years until a final remedy is designed and implemented. Also, the Houston area is visited by seasonal severe weather events (i.e., strong force winds or flooding) and the physical protective barrier must be structurally secure to withstand any potential future extreme weather events (i.e., Hurricane Ike of 2008).

B. Performance Requirements

Evaluation Analysis of the TCRA alternatives involves the three evaluation elements of environmental effectiveness, cost, and implementability for temporary abatement of actual realease releases of dioxin into the San Jacinto River, whileuntil the site is fully characterized and a remedy is selected, considered the following. The performance criteria listed in the TCRA memo dated April 2, 2010: , along with the evaluation elements are summarized below:

1. Temporarily abate the release and threat of release of dioxin from the waste ponds built in 1966 into the San Jacinto River until the site is fully characterized and a remedy is selected.

Control erosion of waste materials

—Contamination from source materials from the waste pits are any soils or sediments 1—ocated within the original 1966 berm footprint with concentrations greater than or equal—to 330 ng/kg TCDD organic carbon normalized or 4.5 ng/kg TCDD nonorganic carbon—normalized.

- Prevent erosion from upland runoff, heavy rains, river and tidal currents, waves,

and

propeller wash-

- Technologies used to control crosion must be structurally sufficient to withstand forces sustained by the river including any future crosion and be structurally

stable for five to seven years ound until the site is fully characterized and a

remedy is selected. a final remedy is designed and implemented.

waste ponds are not affected while-until the nature and extent of contamination of the site is beingfully characterized and thea remedy is selected.

IV. PROPOSED TCRA ALTERNATIVES ANALYSIS

A. <u>Proposed Alternative Descriptions</u>

In accordance with requirements in the May 17, 2010, TCRA AOC, the responsible parties submitted a technical memorandum providing an analysis of various TCRA alternative design options available that temporarily abates the release of dioxin into the San Jacinto River emay that poses an satisfy thimminent and substantial endangerment ase ISE determination specified in the TRCA Memo. Five alternatives were identified by the responsible parties and are summarized below. A detailed analysis of each alternative is provided in the document Revised draft time critical removal action alternatives analysis San Jacinto River Waste Pits superfund site (see Attachment 9).

Alternative 1: Sheet Pile & Granular Cover

- This alternative would involve the use of sheet piling (steel or composite) as physical barrier placed along the 1966 berm location (eastern and western portion) that would temporarily act as a physical barrier isolating the waste pits from the San Jacinto River. In addition, a granular cover consisting of appropriately designed sand, gravel, or rock would be used to contain and prevent contaminated waste and sediment from contaminating the environment. Estimated cost and construction time for alternative 1 is approximately \$5.8 million dollars and take six months to complete.

Alternative 2: Sheet Pile, Granular Cover, Dredge, & Revetment

This alternative would involve the use of sheet piling (steel or composite) as a temporary physical barrier placed along the 1966 berm location (western portion) that would act as a physical barrier isolating the waste pits from the San Jacinto River. Dredging will be conducted along the northwestern portion of the waste pits in combination with the use of rock revetment along the perimeter of the waste pits for containment stability. In addition, a granular cover consisting of appropriately designed sand, gravel, or rock would be used to contain and prevent contaminated waste and sediment from contaminating the environment. Estimated cost and construction time for alternative 2 is approximately \$5.1 million dollars and will take five months to complete.

Alternative 3: Granular cover and revetment

This alternative would involve the use of a granular cover consisting of appropriately designed sand, gravel, or rock would be used to temporarily contain and prevent contaminated waste and sediment from contaminating the environment. Sheet piling is not being used along the perimeter of the waste pits for containment instead a rock berm will be used to isolate the waste pits from the San Jacinto River. Estimated cost and construction time for alternative 3 is approximately \$3.6 million dollars and will take three months to complete.

Alternative 4: Rock berm, granular cover, and revetment

- This alternative is a hybrid of alternative 3 and would use a granular cover along the eastern waste pit and partial granular cover along with a geotextile cover in the western waste pit area. Estimated cost and construction time for alternative 4 is approximately \$4.0 million dollars and will take three months to complete.

Alternative 5: ACBM and dredge

- This alternative would involve the use of an Articulated Concrete Block Matt (ACBM) technology that would be layered over the eastern and western waste pits used to contain and prevent contaminated waste and sediment from <u>further</u> contaminating the environment. A rock submerged rock scour apron will be used along the perimeter of the waste pits to isolate contamination from the San Jacinto River. Estimated cost and construction time for alternative 5 is approximately \$7.0 million dollars and take three months to complete.

B. Proposed TCRA Alternative Concerns

Each alternatives listed above have advantages and disadvantages that must be considered when choosing the most appropriate option that will satisfy the Imminent and Substantial
Endangerment (ISE) determination specified in the TCRA memo. Site specific concerns have been submitted to EPA from Harris County (see Attachment 4) and the Texas Commission on Environmental Quality, TCEQ (see Attachment 5) with regards to the alternatives proposed by the responsible parties. A summary of all concerns raised from the county and state, other stakeholders are summarized below.

- Minimize public health and environmental threat from site contamination.
- Prevent spread and movement of site contamination.
- Storm event design number used for cover material calculation.
- Prevent impacts from flooding upstream and scouring on I-10 bridge downstream which may result from TCRA construction.
- Use of a combination of technologies (i.e. removal w/ containment).

V. PREFERRED TCRA ALTERNATIVE OPTION

A. Preferred Option: TCRA Alternative 3

Formatted: Indent: Left: 0.5"

——All five alternatives temporarily abate the release and threat of release of dioxin from the 1966 waste ponds built in 1966 into the San Jacinto River that present an imminent and substantial endangerment until the site is fully characterized and a remedy is selected. Although

all five alternatives address the ISE stated in the April 2, 2010, Action Memo, Alternative 3 (see Attachment 3) is the best option for temporary containment and source control. Alternative 3 best it-minimizes the of the hydrological impacteon ditions to the San Jacinto River from the source the waste ponds and thereduces migration of contaminated dioxin sediments in the San Jacinto River that have migrated from the waste ponds whileuntil the nature and extent of contamination is being selected.

Formatted: Indent: First line: 0.5"

—Alternatives 1, 2, and 4 all have large barriers around the perimeter of the eastern or western waste ponds that reduces the cross section of the river channel and impinges the natural river flow during flood stage events and which increases likelihood of the river scour downstream and possibly negatively impactsing the potential areas where contaminated dioxin sediments—are located that have originated migrate from the waste ponds. Alternatives 3 and 5 are the least disruptive in changing the river cross section and risk of negatively impacting the potential areas where where contaminated dioxin sediments may have come to be located that have originated migrate from the waste pondsinereased flooding upstream and river scour downstream along the 110 bridge.

Due to the temporary nature of the TCRA; the differences between alternative 3- betterest addresses the temporary abatement of the release of dioxins from the waste ponds into the San Jacinto River that poses an imminent and substantial endangerment rather than alternative and 5. are in the nature of cover used. Alternative 3 uses a combination of granular cover material such as sand, gravel, and rock, while alternative 5 uses an articulated block mat (ACBM) technology. Alternative 3 is better suited as a temporary measure that because it offerseonsistent more and flexibilityle in choosing the a future remedy at the site future non-time critical removal action (NTCRA), while alternative 5 uses a more permanent cover material which is site—more difficult to remove than alternative 3, and thus reduce the flexibility in the selection of the a-future remedy at the site.

<u>B</u>A. <u>Modification to Proposed TCRA Alternative 3</u>

A modified version of TCRA alternative number three proposed by the respondents in the June 15, 2010, Technical Memo (Attachment 3) will-satisfy the best temporarily abate the release of dioxin into the San Jacinto River that poses an imminent and substantial endangerment ISE determination-outlinedspecified in the TCRA memo and is the preferred alternative for immediate design and construction. The two modifications involve 1) the change of the design storm event calculation and 2) eonsider encourage the use of a geo-membrane or instead of a geo textile fabric technology for use underneath granular cover that will minimize or prevent movement of contaminants as colloids and diffusive loss of pore water preventing benthic and human contact.

Currently, the respondents are proposing to use a granular cover material sized and corresponding gradation to resist a 10 year return interval flow design storm event (see Appendix

Formatted: Indent: First line: 0"

A, Attachment 3) for the cover on top of the waste pits to ensure containment. After consideration from comments received from Harris County (Attachment 4), TCEQ (Attachment 5), and independent review from a licensed professional engineer contracted by the EPA (see Attachment 6) a 10 year design storm event being proposed for alternative 3 is inappropriate.

TCRA performance measures are dependent upon the overall stability of the surrounding channel. Moreover, the performance measures are dependent upon the overall surrounding system of the channel, therefore alternative 3 cover material should utilize a design that considers storm events with a return period of 100 years. The TCRA design should follow design criteria specified by the 1994 U.S. Army Corps of Engineers document named "EM 1110-2-1601 entitled "Hydraulic Design of Flood Control Channels."

While the first modification for change of the design storm number to a 100 year return period is required; the second modification, is optional, but highly encouraged due to concerns of movement of contaminates as colloids.

CB. Preferred TCRA Alternative

This decision document represents the preferred alternative removal option of aAlternative 3, with the above stated modifications, for the implementation of the TCRA at San Jacinto River Waste Pits site near Houston, Harris County, Texas, is developed in accordance with CERCLA, 42 U.S.C.§ 9601 et seq., and consistent with the NCP, 40 CFR § 300. In addition, the implementation of an EPA approved TCRA alternative 3 and operation and maintenance (O&M) plan will detail the need for theadditional environmental sampling and monitoring requirements for the site to to ensure performance requirements are being met for the selected removal option alternative. This decision is based on the administrative record for the site.

Conditions at the site meet the NCP section 300.415(b)(2) criteria for the removal alternative and I recommend your approval of the preferred removal action alternative option stated above. No funding will come from the Regional removal allowance for this preferred removal action alternative option.

Approved:		Date:
	Charles Faultry, Associate Director	
	Remedial Branch,	
	Superfund Division
